Proxy Class

Logic

POST XML (SOAP) over HTTP

```
<soapenv:Envelope
xmlns:soapenv="http://
schemas.xmlsoap.org/soap/envelope/"
xmlns:tem="http://tempuri.org/">
  <soapenv:Header/>
  <soapenv:Body>
    <tem:Divide>
      <!-Optional:->
      <tem:x>4</tem:x>
      <!-Optional:->
      <tem:y>0</tem:y>
    </tem:Divide>
  </soapenv:Body>
</soapenv:Envelope>
```

server

XML (SOAP) (over HTTP)

.NET Core / Web API 2 (.NET Framework)

```
POST api/customers HTTP/1.1
Host: localhost
Content-Type: application/json
{blank-line}
{
  "firstname": "Marcin", "lastname":
  "Sulecki"
}
```

```
POST api/customers HTTP/1.1
Host: localhost
Content-Type: application/xml
{blank-line}
<xml>
  <firstname>Ashish</firstname>
  <lastname>Seghal</lastname>
</xml>
```

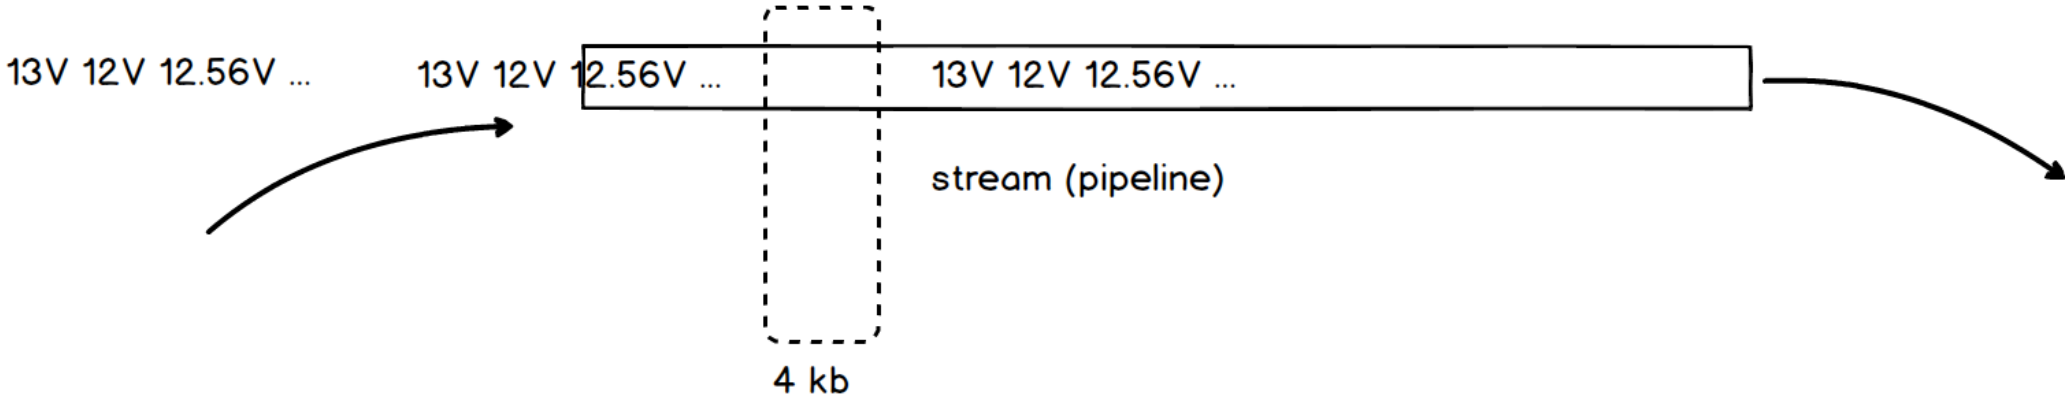

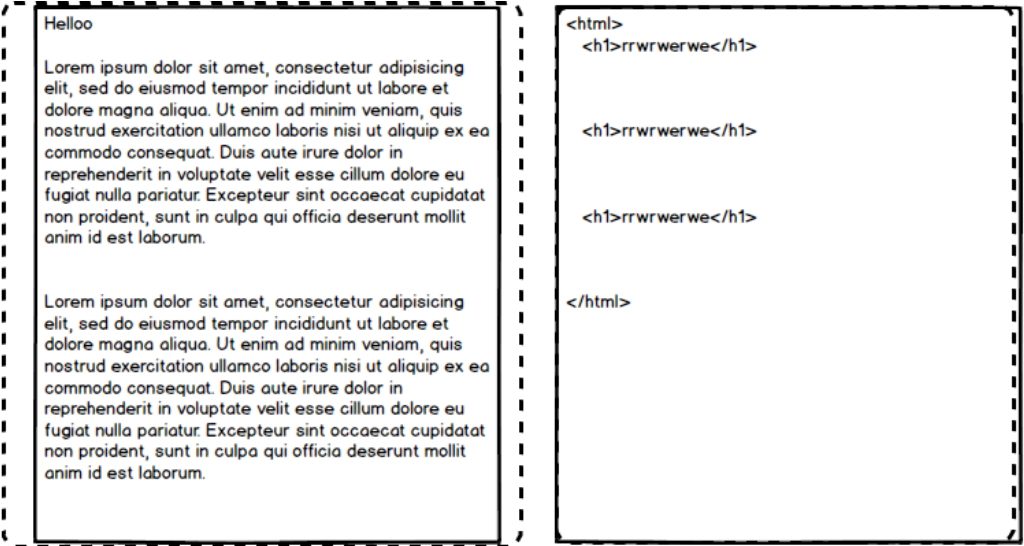

```
GET api/customers/10 HTTP/1.1
Host: localhost
Accept: application/json
```

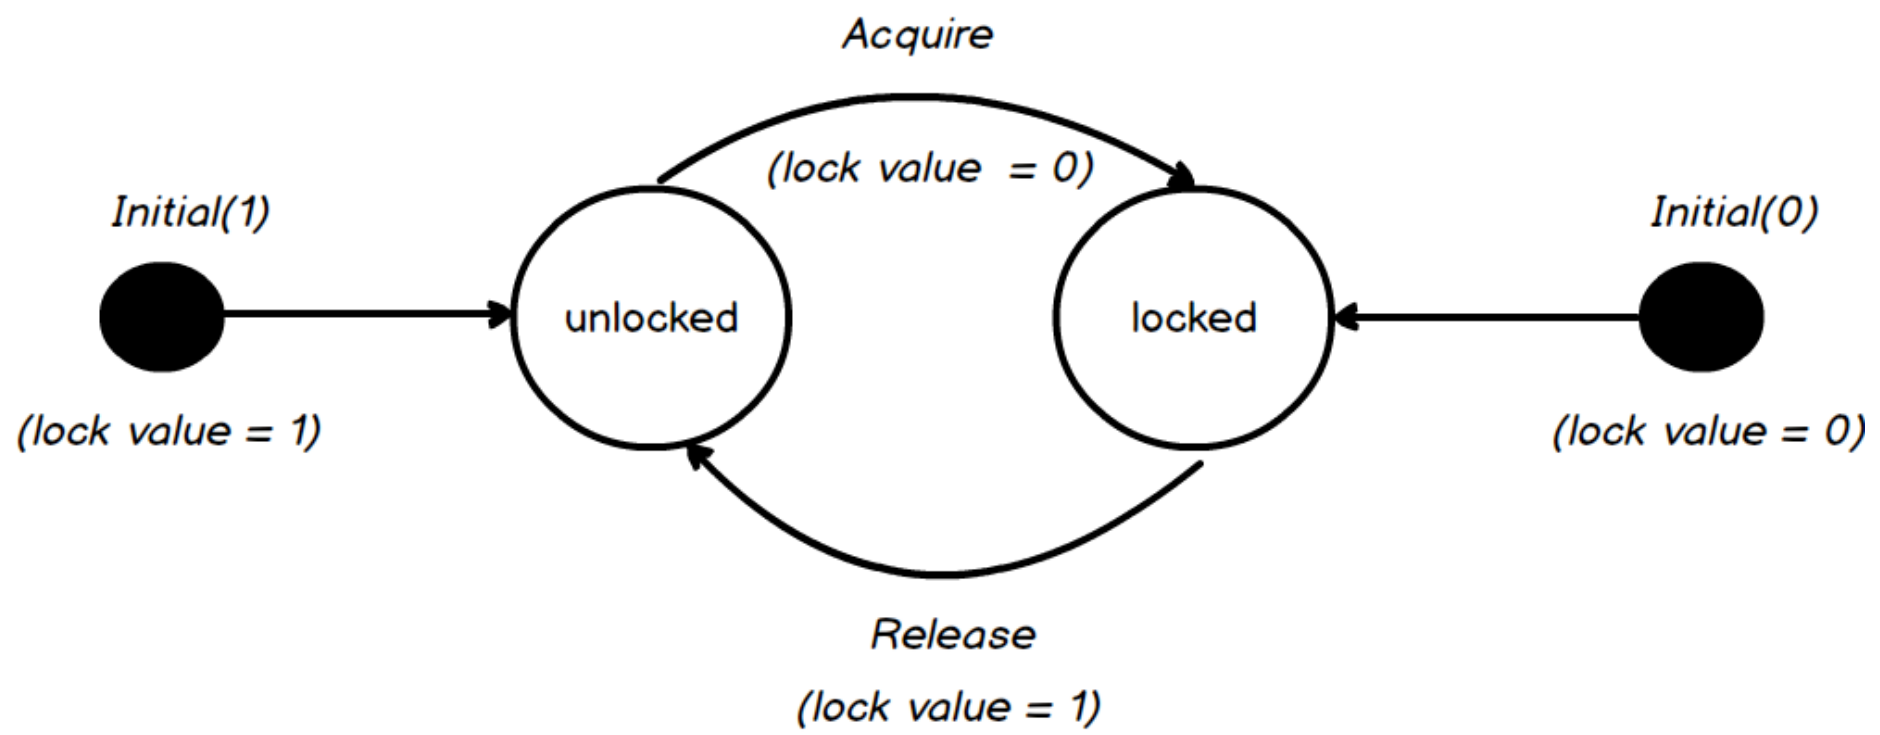

```
GET api/customers HTTP/1.1
Host: localhost
Accept: application/json
```

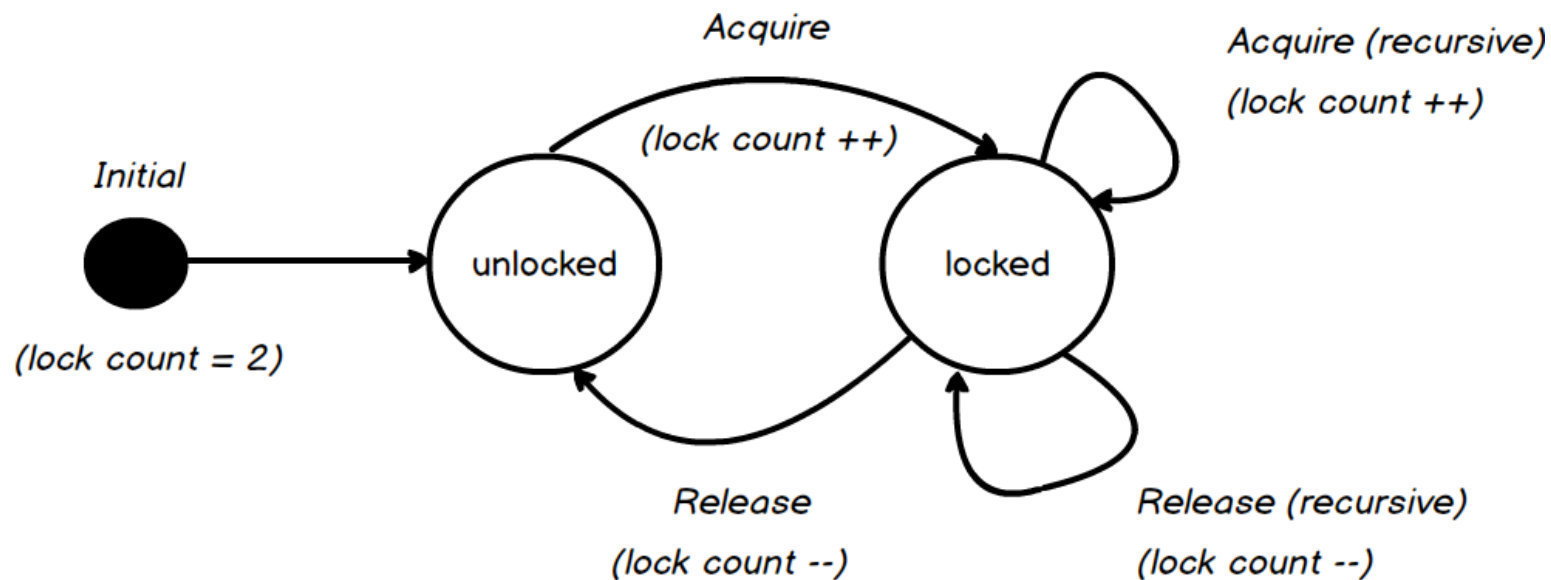

```
PUT api/customers/10 HTTP/1.1
Host: localhost
Content-Type: application/json
{
  "firstname": "Bartek", "lastname":
  "Sulecki"
}
```

```
PATCH api/customers/10 HTTP/1.1
Host: localhost
Content-Type: application/json
{
  "firstname": "Bartek"
}
```

```
DELETE api/customers/10 HTTP/1.1
Host: localhost
```

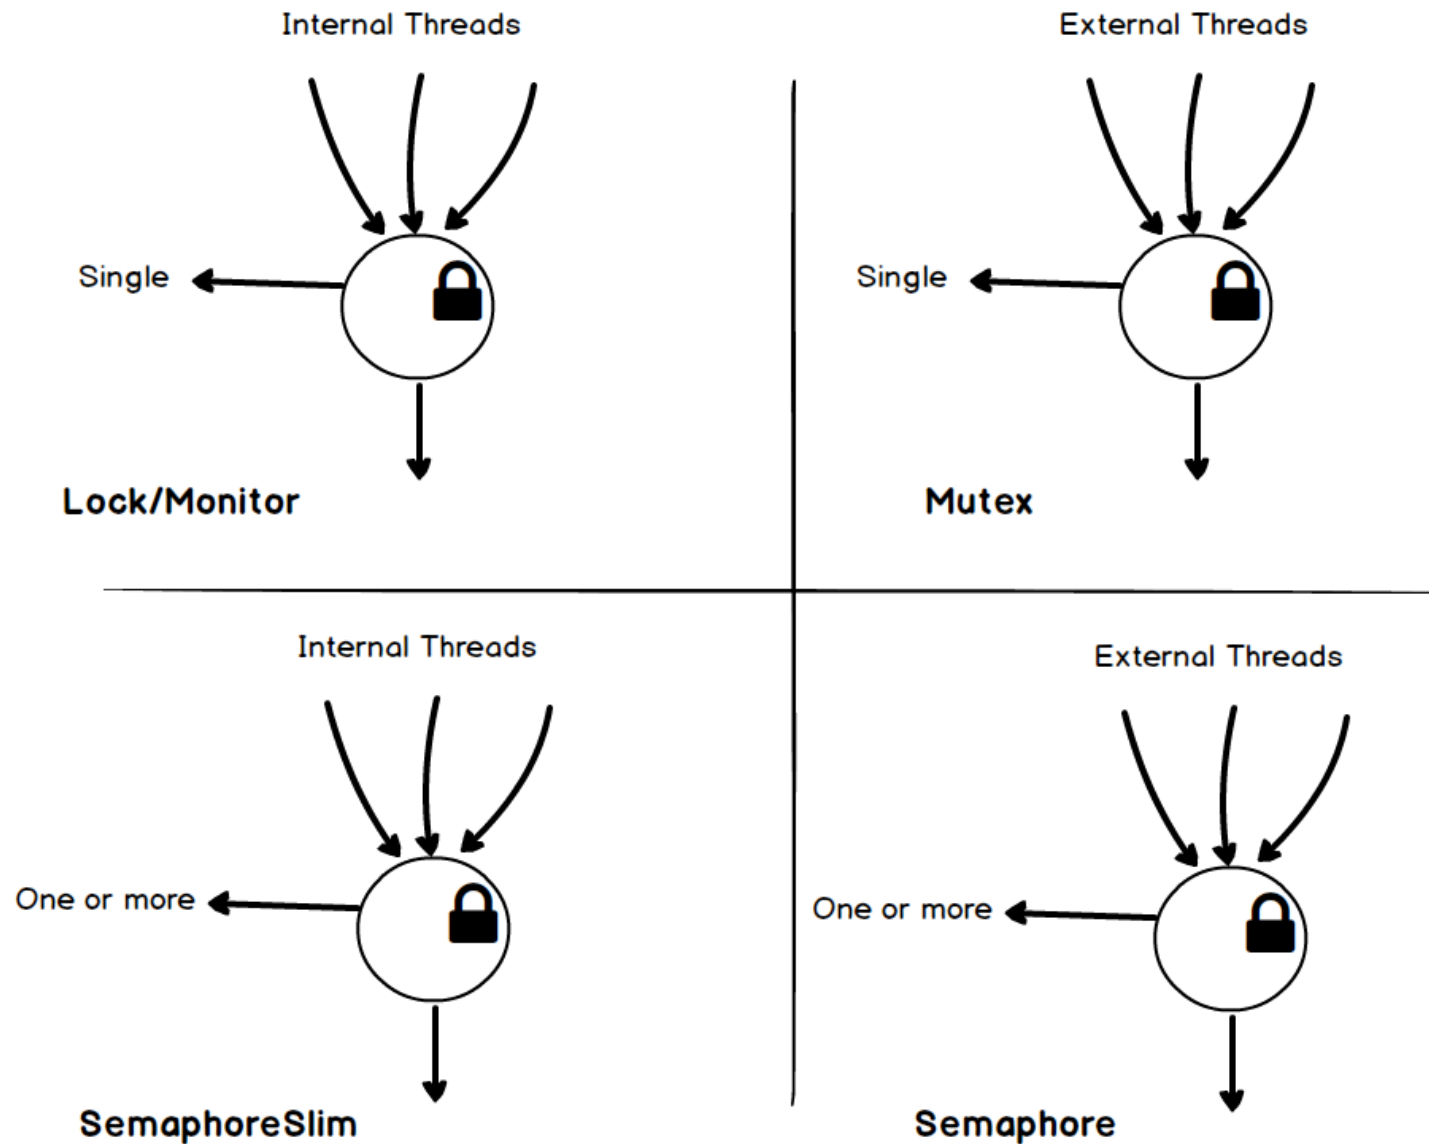

```
procedure V (S : Semaphore; I : Integer);
begin
  S := S + I (* operacja atomowa *)
end;

procedure P (S : Semaphore; I : Integer);
begin
  (* cała operacja jest atomowa *)
  repeat
    Wait();
  until S >= I;
  S := S - I;
end;
```

Monitor vs Mutex vs Semaphore vs SemaphoreSlim

thread1

Debit(100)

thread2

Credit(50)

balance = 1000

The diagram shows a central circle labeled 'balance = 1000' inside a square frame. Two threads are shown interacting with this resource. 'thread1' is on the left, with an arrow pointing to the circle labeled 'Debit(100)'. 'thread2' is on the right, with an arrow pointing to the circle labeled 'Credit(50)'.
